Hardware Overview

Christmann offers the RECS®|Box microserver architecture in [different chassis](#):

On every baseboard, different compute modules can be plugged, e.g. the newly developed hardware accelerated ARM module. The FPGA based accelerator can boost the energy efficiency of your application to a factor of over 120 compared to a classical CPU implementation and still [double energy efficiency compared to an optimized GPU implementation](#).

- A new high-speed interconnection between FPGAs has been integrated in the RECS®|Box which reaches a speed of 40 Gb/s and 320 ns latency.

Free hardware test access

Interested in testing out the hardware? [Drop us a mail!](#)

[Hardware access](#) to heterogeneous and fully equipped hardware is possible through a collaboration with PSNC. PSNC (the Poznan Supercomputing and Networking Center) is successfully using the RECS®|Box for software analysis and optimisation for energy efficiency in various research projects, e.g. [FiPS](#) and [M2DC](#).
